Compressed: 10.48"

Ride Height: 12.55"

Extended: 14.08"

Major ComponentsIn the box

Item #	Part #	Description	QTY
1	986-10-070	3.6" Stroke TQ Series Shock	2
2	59080750	CoilSpring 8" 750lb	2
3	70010828	Delrin Spring Washer	4
4	803-00-199(kit)	Lower Spring Adjuster Nut (803-00-199 kit)	2
5	803-00-199(kit)	Adjuster Nut Locking Screw (803-00-199 kit)	2
6	803-00-199(kit)	Upper CoilSpring Retaining Plate (803-00-199 kit)	2
7	803-00-199(kit)	CoilSpring Plate Retaining Ring (803-00-199 kit)	2
8	90009989(kit)	2.75" Stud Adjuster Assembly	2
9	90002313	2.75" Stud Top Base	2
10	90001904	Delrin Ball Lower Half	2
11	90001903	Delrin Ball Top Half	2
12	90001902	Delrin Ball Upper Cap	2
13	99562003	9/16-18" Nylok Nut	2
14	210-35-120-0	Shock Adjuster Knob	2
15	90009969	Adjuster Knob Retaining Screw	2
	026-05-000	Reservoir Mounts	4
	90005000	Resercoir Mount Socket Head Cap Screw	12
	90001994	5/8" ID Bearing (installed in shock body)	2
	90001995	Bearing Snap Ring (installed in shock body)	4
	85000003	Hex Wrench for Reservoir Mounting Screws	1

BEARING SPACERS (90002062) ARE INCLUDED WITH THE FRONT LOWER CONTROL ARMS

CoilOver Assembly

- 1.** To Assemble the CoilOver you need to:
 - a.** Remove Screw (2) from center of Adjustment Knob (1) and remove Adjustment Knob.
 - b.** Remove Nylok Nut, Delrin Upper Cap, Delrin Upper and Lower Balls, along with the base from the CoilOver stud.
 - c.** Thread Adjuster Nut (3) onto the CoilOver body. Once it is threaded on the shock body, lightly thread in the locking screw (4) into the Adjuster Nut.
 - d.** Install a Delrin Spring Washer (5) onto the Adjuster Nut.
 - e.** Slide the CoilSpring (6) onto the CoilOver.
 - f.** Install another Delrin Spring Washer (5) on top of the CoilSpring.
 - g.** Install the Upper CoilSpring Plate (7) onto the CoilSpring.
 - h.** Install the CoilSpring Retaining Ring (8) onto the Stud Top Base (9). It fits into the groove in the base.
 - i.** Slide the Stud Top Base onto the shock until it bottoms out on the stud. It may be necessary to thread the Adjuster Nut down the shock body (to lower the spring) if the base will not slide all the way down onto the stud.
 - k.** Slide the Lower Delrin Ball (10) (it has the collar sticking up around the center hole) on to the Stud Top.

Repeat on second CoilOver.

CoilOver Installation

1. Drill the OEM shock hole out to 3/4". This can be done with a Unibit.

2. The CoilOver stud top will come in contact with the coil spring retainer, so it must be opened up towards the engine. **Image 2** has a white line illustrating where to cut the opening for stud top clearance. A die grinder works well here.

3. **Image 3** shows the spring retainer trimmed out.

Note: It may be helpful to go ahead and install the lower StrongArms and CoilOvers to check if any more trimming is necessary.

CoilOver Installation

2.

2. With the CoilOver(1) assembled, it is time to bolt them into the car. **The factory shock hole will need to be drilled out to 3/4", this can best be done using a Unibit.** Insert to CoilOver Stud Top through the factory hole in the frame. Install the Upper Delrin Ball(2) onto the shock stud with the flat side facing the frame. Next, Install the Delrin Ball cap (3) onto the shock stud with the Concave side facing the Upper Delrin ball. Install the Nylok Nut(4) onto the shock stud and lightly tighten. The needs to be some resistance on the ball but not tight enough that it will not rotate freely. Reinstall the adjuster knob(5) using the screw (6) that was removed during step 1.

TIGHTENING THE TOP 9/16"-18 NUT: SNUG THE NUT DOWN AGAINST THE TOP CAP. YOU NEED TO BE ABLE TO ARTICULATE THE SHOCK BY HAND. WE TORQUE THE NUT TO 80 INLBS USING A 7/8" CROWS FOOT WRENCH ON A TORQUE WRENCH.

3.

3. Install a spacer on each side of the lower Coilover. Slide the shock with the spacers installed into the lower control arm. Raise the arm up to line up the holes in the bushing with the 1/2" hole in the control arm straps and hold it in place while you install the 1/2" x 3 1/2" bolt, 1/2" flat washer, and 1/2" Nylok nut. Tighten the upper and lower shock bolts.

	2	99561001	9/16"-18 x 2 1/2" Hex Bolt	Cross Shaft to Frame
	2	99566003	9/16" SAE Flat Washer	Cross Shaft to Frame
	2	99562001	9/16"-18 Nylok Nut	Cross Shaft to Frame

Getting Started.....

Congratulations on your purchase of the Ridetech 58-64 B-Body StrongArms. These StrongArms have been designed to give your B-Body excellent handling along with a lifetime of enjoyment. Some of the key features of the StrongArms: Ball joint angles have been optimized for the lowered ride height, Delrin bushings are used to eliminate bushing deflection along with providing free suspension movement through the entire travel. The Delrin bushings are made from a material that is self lubricating so no grease zerks are needed.

1. Remove the lower control arms from the car. If you are replacing the upper control arms and spindle, remove them too. Refer to a Factory Service Manual for the proper method.

Installation

2.

Driver Side
Top View

2. The Lower Control Arm is attaching the frame using the included hardware. The driver side arm is shown in **Figure "2"**. The sway bar mount is located to the front of the car.

Install the ShockWaves/CoilOvers at this time. Refer to the ShockWaves/CoilOvers instructions for Assembly.

3.

3. The Aluminum Clamp is installed in the notch machined in the lower cross shaft. Install a 7/16" Split Lock Washer on each of (2) 7/16"-20 x 2" Hex Bolts. Install a 9/16" Flat Washer on a 9/16"-18 x 2 1/2" Hex Bolt. Hold the control arm in-place with the holes aligned with the holes in the frame. Insert the 7/16" bolts in the holes of the cross shaft clamp and thread them into the OEM nut plate that is in the frame. Insert the 9/16" bolt/washer in the rear hole of the cross shaft and through the frame. Install a 9/16"-18 Nylok Nut on the threads of the bolt that are sticking through the frame. Torque the 7/16" hardware to 55 ftlbs. Torque the 9/16" hardware to 120 ftlbs.

4.

4. Bolt the Shockwave or CoilOver to the lower arm using the supplied 1/2" x 3 1/2" bolt, 1/2" flat washers, and 1/2" nylok nut. Insert the supplied aluminum spacers in each side of the shock bearing and slip it into the control arm. Line the spacers/bearing up with the 1/2" hole in the shock straps of the control arm and install hardware. Torque the 1/2" hardware to 75 ftlbs.

Installing Spindle and Alignment

5. Attach the Spindle to the control arms. These control arms use a tall ball joint, the boot will NOT touch the spindle. This is normal.

Torque Specs:

Ball joint - 45 ftlbs and tighten to line up cotter pin.

Install the Cotter Pin after tightening the ball joint nut.

6. Attach the adjustable steering stop to the lower arm using (2) 5/16" x 1" bolts, (4) 5/16" flat washers, & (2) 5/16"-18 nylok nuts.. This can be adjusted to maintain tire/shock clearances. Torque the steering stop hardware to 25 ftlbs.

7. Tighten all fasteners and grease the ball joints. Connect the sway bar linkage to the new StrongArms. If you are going to install the Ridetech MuscleBar, now is a good time to do it.

Suggested Alignment Specs:

Camber:	Street: -.5 degrees
Caster:	Street: +3.0 to + 5.0 degrees
Toe:	Street: 1/16" to 1/8" toe in

8	99371014	3/8"-24 x 1 1/4" Hex Bolt - Cross Shaft	4

Getting Started.....

Congratulations on your purchase of the Ridetech StrongArms. These StrongArms have been designed to give your car excellent handling along with a lifetime of enjoyment. Some of the key features of the StrongArms: Ball joint angles have been optimized for the lowered ride height, Delrin bushings are used to eliminate bushing deflection along with providing free suspension movement through the entire travel. The Delrin bushings are made from a material that is self lubricating so no grease zerks are needed.

Installation

1. Remove the upper control arms from the car. Keep the shims separate so that you can put them back in the location they were removed from. If you are replacing the lower control arms and spindle, remove them too. Refer to a Factory Service Manual for the proper method.

2. Insert the Ball Joint into the Control Arm from the TOP side with the Stud pointing downward. Insert the supplied Bolts from the top side. Install a Lock Washer and Hex Nut on the threads of each bolt. Torque the hardware to 25 ftlbs.

3. The Upper Control Arm is attached to the factory frame using factory hardware. The driver side arm is shown in **Figure "3"**. The Ball joint is located on the arm to the REAR of the car.

Installing Spindle and Alignment

4. The Upper Control Arm is attaching the factory mount using factory hardware. Reinstall the shims in the location they were removed from. The passenger side arm is shown in **Figure "4"**. Torque the OEM nuts to 50 ft-lbs.

5. Attach the Spindle to the control arms. These control arms use a tall ball joint, the boot will NOT touch the spindle. This is normal.

Torque Specs:

Ball joint - 45 ftlbs and tighten to line up cotter pin.

Install the Cotter Pin after tightening the ball joint nut.

6. Tighten all fasteners.

Suggested Alignment Specs:

Camber:	Street: -.5 degrees
Caster:	Street: +3.0 to + 5.0 degrees
Toe:	Street: 1/16" to 1/8" toe in

HARDWARE

QTY	Part Number	Description
4	99311002	5/16"-18 x 1 1/4" Hex Bolt
4	99311003	5/16"-18 x 1 1/2" Hex Bolt
8	99313002	5/16" Flat Washer
4	99372003	5/16"-18 Nylok Nut

Getting Started.....

Note: This sway bar kit utilizes a anti-friction lining in the sway bar bushing. The lining allows the sway bar to move freely and quietly in the bushing. No lubrication is required.

1. Jack the vehicle up to a safe working height and support with jack stands. Make sure the jack stands are stable before working under the car.
2. Remove the stock sway bar.
3. Due to the larger diameter of your new swaybar, the Idler Arm will need to be disconnected from the frame to install the new sway bar.

NOTE: IF YOUR CAR HAS THE FACTORY POWER STEERING SLAVE CYLINDER, KIT 11059121 WILL BE NEEDED TO INSTALL THE STREETGRIP SWAYBAR

4. Open the sway bar bushing at the split and slip it **OVER** the sway bar. Do this for both bushings

5.

5. Disconnect the idler arms from the frame.

6.

6. Insert the new swaybar from the passenger side. position it above the idler arm and steering arm. the center of the bar should hang down towards the ground.

7.

7. Install a 5/16" flat washer on each of (2) 5/16"-18 x 1 1/4" bolts and insert them into the OEM sway bar holes by inserting them in through the access holes in the side of the frame. Install the spacer plate with the wide side positioned to the inside. Hold it in place.

8.

8. Install the bushing strap over the swaybar bushing with the wide side of the strap to the inside on the car. We found some steering box conversions hang down further than others. If yours happens to hit the sway bar, add a 2nd spacer under the bushing. a 2nd set of spacers along with longer hardware is supplied in this kit.

9.

9. Lift the bar in position, the bolts sticking through the frame and spacer will go in the slots of the bushing strap. Hold the bar in place & install a 5/16" flat washer and 5/16"-18 nylok nut on the threads of each bolt sticking through the slots of the bushing strap. Repeat steps 8-10 on the opposite side, but do not tighten the hardware at this time.

10.

10. Reattach the idler arm to the frame using the OEM hardware. Torque the hardware.

11.

11. Install the End Links using **Diagram 1** as a reference. Install both end links before tightening the end link hardware. Tighten the end link barrel nut until it is flush with the end of the bolt, and then tighten it 2 more complete rounds.

12. Torque the SwayBar mounting hardware to 17 ftlbs.

Diagram 1

Part # 11046699 - 1958 Full Size Chevy Rear Upper StrongArm Kit

Recommended Tools

1958 GM "B" Body Rear Upper StrongArm Installation Instructions

Table of contents

Page 2..... Included Components
Page 3..... Installation

Included ComponentsIn the box

Item #	Part #	Description	QTY
1	90000505	Rear Upper Control Arm	1
2	70010759	Bushing Half	4
3	90000549	Inner Bushing Sleeve	2
4	99501005	1/2"-13 x 3 1/2" Bolt	3
5	99502009	1/2"-13 Nylok Nut	3
6	99503014	1/2" SAE Flat Washer	3

Getting Started.....

1. Raise the vehicle up to a comfortable work height. You will need the support the car by the frame to be able to freely raise and lower the rear axle. Use a jack under the differential to support it. It is best to put the jack toward the pinion, you may need to raise or lower the pinion to attach the control arm to the differential.

Note: Install the lower control arms before installing the upper control arm.

2. Remove the OEM upper control arm from the car.

3. Inspect the bushings in the differential, replace if necessary.

Upper StrongArm Installation

- 4.** Bolt the new upper control arm in the OEM location using the hardware supplied in the kit. The control arm is attached to the car using (3) 1/2"-13 x 3 1/2" bolts, 1/2" flat washers, and 1/2"-13 nylok nuts. Tighten the hardware enough to eliminate any gaps.

					2	99313003	5/16" Split Lock Washer

R-JOINT SPACER INSTALLATION

Install the Spacers by inserting the SMALL side of the SPACER into the Center Pivot Ball. Push them in until they bottom out and stop.

UPPER R-JOINTS

New R-Joints will be quite stiff (75-90 in/lbs breakaway torque) until they "break in" after a few miles of use. After the break in period they will move much more freely. Because the composite bearing race contains self lubricating ingredients, no additional lubrication is needed or desired. Any additional lubrication will only serve to attract more dirt and debris to the R-Joint and actually shorten its life.

Getting Started.....

Congratulations on your purchase of the Ridetech B-Body CoilOver StrongArms. These StrongArms have been designed to give your B-Body excellent handling along with a lifetime of enjoyment. Some of the key features of the StrongArm System: The StrongArms are designed to utilize a CoilOver Shock setup, R-Joints are used to eliminate bushing deflection along with providing free suspension movement through the entire travel. The R-Joints are made from a material that is self lubricating so no lubrication is needed.

Note: These control arms are designed for use with the Ridetech CoilOvers and the MuscleBar swaybar. **The factory shocks and springs will not fit these StrongArms. If you have a swaybar that attaches to the lower control arms, it will NOT work with these StrongArms.**

1. Raise the vehicle up to a comfortable work height. You will need the support the car by the frame to be able to freely raise and lower the rear axle. Use a jack under the differential to support it.
2. Remove the rear shocks, coil springs, and lower control arms. The lower shock mounts are lightly pressed into the lower control arm mount and will not turn. You will need to drive these out with a hammer. Put something over the end of the threads to keep from damaging them.

Upper Mount Installation

2. This kit contains a Upper Shock Mount setup that will require drilling to install it. **Image 2** is of the upper mount installed, we will cover the installation in the next steps. The rear of the plate will need to be aligned with the body mount that is to the rear of the coil spring mount. See the ARROW in **Image 2**.

3. The upper mount bolts into the car and will require the holes to be drilled. Start by holding the plate up in the car aligning the back edge with the body mount. Mark the holes on the frame.

4. The frames of these cars varied through the years, some have a center hole, some are solid. The frame we are doing this install on has a center hole. If the frame is solid, drill the marked holes with a 1/2" drill bit. Frames with the center hole will require a die-grinder or something similar to notch the edges of the center hole. We used a die-grinder with a burr bit to notch the holes. Repeat **Steps 2-4** on the opposite side.

Upper Mount Installation

6. The Upper Mount is attached to the frame using (2) 1/2"-13 x 1 1/2" Bolts. Insert the bolts through the shock mount and into the upper plate.

7. Position the Shock Mount/Plate up into the frame, holding the shock mount and hardware in place.

8. Install the Upper Backer plate by installing it on the 1/2" bolts that are sticking through the top side of the frame. Install a 1/2"-13 nylok nut on each of the bolts sticking through the frame and backer plate. Torque the hardware to 75 ftlbs. Repeat for the second side of the car.

Lower StrongArm Installation

9.

9. The Lower Control Arm has the bottom CoilOver mount built in, it will need to be installed with the CoilOver mount up and to the rear of the car. Install a 5/8" ID R-joint Spacer into the front R-joint. The Small Diameter goes into the R-joint. Slide the R-joint into the OEM lower control arm mount. Align the holes in the frame with the thru-hole of the R-Joint.

NOTE: This kit contains (4) 5/8"-18 x 4" bolts, 2 of these bolts have a FLAT machined into them. The 2 bolts with the flat will be used in the REAR of the lower control arms.

10.

10. Install a 5/8" Flat Washer on a 5/8"-18 x 4" bolt. Insert the bolt/washer into the frame/R-Joint of the lower bar. Install a 5/8" flat washer and 5/8"-15 nylok nut on the threads of the bolt sticking through the frame. Tighten the hardware to eliminate any gaps.

11.

11. Install the R-joint spacers into the rear R-Joints. Slide the rear of the lower control arm into the axle mount. Line up the mounting holes in the axle mount with the center hole of the R-joint. THE REAR R-JOINT REQUIRES THE 5/8"-18 x 4" BOLT WITH THE FLAT MACHINED INTO THE THREADS. Install a 5/8" flat washer on the 4" bolt with the flat. Insert the bolt/washer through the mounting hole. Align the Flat with the flat in the outer flange of the lower axle mount. Install a 5/8" flat washer and 5/8"-15 nylok nut on the threads of the bolt sticking through the frame. Tighten the hardware to eliminate any gaps

Shock Installation

12. Insert the shock bearing t-bushings into the bearing of the shock body. Insert the shock into the upper mount, lining up the holes of the mount and shock. Install a 1/2" flat washer on a 1/2"-13 x 2 1/2" bolt. Insert the bolt/washer into the upper mount/shock. Install a 1/2" flat washer and 1/2"-13 nylok nut and Torque to 50 ftlbs.

13. Insert the shock bearing t-bushings into the bearing of the shock eyelet. Insert the shock into the lower control arm, lining up the holes of the mount and shock. Install a 1/2" flat washer on a 1/2"-13 x 2 1/2" bolt. Insert the bolt/washer into the upper mount/shock. Install a 1/2" flat washer and 1/2"-13 nylok nut and Torque to 50 ftlbs.

14. Bolt the tab of the emergency brake cable to the provision in the lower control arm. This provision is built into the lower shock mount. Use the 5/16"-18 x 3/4" bolt, 5/16" split lock washer, and 5/16" flat washer to attach the cable. Torque the hardware to 12 ftlbs.

CoilOver Assembly...

ridetech 

1

First, using the supplied lower adjuster nut (803-00-199) thread the nut onto the shock from the bottom side as seen in figure 1. Remove the plastic pellet that is in the split of the adjuster nut.

4

Once the knob is removed slide a Delrin washer over the eyelet. Next, slide the upper spring mount (803-00-199) over eyelet as seen in figure 4.

2

Next, install a delrin washer then coil spring over the top of the shock as seen in figure 2.

5

Install upper spring mount retainer clip (803-00-199) into the groove on the upper eyelet as seen in figure 5. Then, reinstall adjuster to complete assembly.

3

Before the upper spring mount can be installed screw the adjuster knob on the upper eye mount to the firmest setting (clockwise) as seen in figure 3. Then remove the Knob by holding it while removing the center screw.

Install the locking screw in the adjuster nut before setting spring preload, but DO NOT tighten until the spring preload has been set.

NOTE: Remember to adjust the shock valving before driving, the shock is currently set to full stiff.

Shock Adjustment 101- Single Adjustable

Rebound Adjustment:

How to adjust your new shocks.

The rebound adjustment knob is located on the top of the shock absorber protruding from the eyelet.

You must first begin at the ZERO setting, then set the shock to a medium setting of 12.

-Begin with the shocks adjusted to the ZERO rebound position (full stiff). Do this by rotating the rebound adjuster knob clockwise until it stops.

-Now turn the rebound adjuster knob counter clock wise 12 clicks. This sets the shock at 12. (settings 21-24 are typically too soft for street use).

Take the vehicle for a test drive.

-if you are satisfied with the ride quality, do not do anything, you are set!

-if the ride quality is too soft increase the damping effect by rotating the rebound knob clock wise 3 clicks.

Take the vehicle for another test drive.

-if the vehicle is too soft increase the damping effect by rotating the rebound knob clock wise 3 additional clicks.

-If the vehicle is too stiff rotate the rebound adjustment knob counter clock wise 2 clicks and you are set!

Take the vehicle for another test drive and repeat the above steps until the ride quality is satisfactory.

Note:

One end of the vehicle will likely reach the desired setting before the other end. If this happens stop adjusting the satisfied end and keep adjusting the unsatisfied end until the overall ride quality is satisfactory.

Shock Adjustment

Shock Adjustment 101- Triple Adjustable

Triple Adjustable:

Step One: High Speed Compression

-High speed compression adjustments are used in both street driving and track tuning.

-Begin with the shocks adjusted to the ZERO high speed compression position (full stiff). Do this by rotating the high speed compression adjuster (large knob) clockwise until it stops.

-Now turn the high speed compression adjuster knob counter clock wise 20 clicks. This sets the shock at 20. (settings 21-24 are typically too soft for street use. For typical street driving the high speed compression adjuster will remain at setting 20.

Step Two: Low Speed Compression

Low speed compression adjustment is what is typically felt during street driving.

-Begin with the shocks adjusted to the ZERO low speed compression position (full stiff). Do this by rotating the low speed compression adjuster (small knob) clockwise until it stops.

-Now turn the low speed compression adjuster knob counter clock wise 20 clicks. This sets the shock at 20. (settings 21-24 are typically too soft for street use). Take the vehicle for a test drive.

-if you are satisfied with the ride quality, do not do anything, you are set!

-if the ride quality is too soft increase the damping effect by rotating the low speed compression knob clock wise 3 clicks.

Take the vehicle for another test drive.

-if the vehicle is too soft increase the damping effect by rotating the low speed compression knob clock wise 3 additional clicks.

-If the vehicle is too stiff rotate the low speed compression adjustment knob counter clock wise 2 clicks and you are set!

Take the vehicle for another test drive and repeat the above steps until the ride quality is satisfactory.

Step 3:

Adjust rebound according to Single Adjustable instructions.

Note:

One end of the vehicle will likely reach the desired setting before the other end. If this happens stop adjusting the satisfied end and keep adjusting the unsatisfied end until the overall ride quality is satisfactory.

Final Tightening and Adjusting

Ride Height

We have designed most cars to have a ride height of about 2" lower than factory. To achieve the best ride quality & handling, the shock absorber needs to be at 40-60% overall travel when the car is at ride height. This will ensure that the shock will not bottom out or top out over even the largest bumps. Measuring the shock can be difficult, especially on some front suspensions. Measuring overall wheel travel is just as effective and can be much easier. Most cars will have 4-6" of overall wheel travel. One easy way to determine where you are at in wheel travel is to take a measurement from the fender lip (center of the wheel) to the ground. Then lift the car by the frame until the wheel is just touching the ground, re-measure. This will indicate how far you are from full extension of the shock. A minimum of 1.5" of extension travel (at the wheel) is needed to ensure that the shock does not top out. If you are more than 3" from full extension of the shock then you are in danger of bottoming out the shock absorber.

Adjusting Spring Height

When assembling the CoilOver, screw the spring retainer tight up to the spring (0 preload). After entire weight of car is on the wheels, jounce the suspension and roll the car forward and backward to alleviate suspension bind.

- If the car is too high w/ 0 preload then a smaller rate spring is required. Although threading the spring retainer down would lower the car, this could allow the spring to fall out of its seat when lifting the car by the frame.
- If the car is too low w/ 0 preload, then preload can then be added by threading the spring retainer up to achieve ride height. On 2.6" - 4" stroke shocks, up to 1.5" of preload is acceptable. On 5-7" stroke shocks, up to 2.5" of preload is acceptable. If more preload is needed to achieve ride height a stiffer spring rate is required. Too much preload may lead to coil bind, causing ride quality to suffer.

Getting Started.....

Congratulations on your purchase of the Ridetech Rear Muscle Bar. These system has been designed to give your car excellent handling along with a lifetime of enjoyment. One of the key features of this MuscleBar: Posilinks - The Posilink makes the reaction of the swaybar instantaneous, tune ability - this Musclebar has 3 positions to aid in the tuning of the handling of your car.

The MuscleBar has 3 positions to aid in the tuning of your cars handling. We start in the front position and tune from there. The positions to the rear of the car will make the MuscleBar stiffer.

Note: This sway bar kit utilizes a anti-friction lining in the sway bar bushing. The lining allows the sway bar to move freely and quietly in the bushing. No lubrication is required.

1. This sway bar kit utilizes a anti-friction lining in the sway bar bushing. The lining allows the sway bar to move freely and quietly in the bushing. No lubrication is required.

MuscleBar Installation

2.

2. Open the SwayBar Bushing at the split and slip it **OVER** the sway bar. Do this for both bushings.

3.

3. Install the Bushing Straps over the SwayBar Bushings.

4.

4. Install the U-bolts over the axle, slide the saddles onto the u-bolts along with the MuscleBar. The MuscleBar should be centered on the rear end. Install the 7/16" washer and Nylok nut loosely for now. **DO NOT TIGHTEN THE NUTS AT THIS TIME.**

Note: It may be necessary to trim the panhard mount to get the saddle to sit in place properly on the axle tube. The saddle should be level with the ground.

Note: With the arms parallel with the ground the rear of the Muscle bar should be angle down towards the ground.

MuscleBar Installation

5a.

5a. There is a Driver and Passenger frame bracket. In **Illustrations 5a & 5b**, the drivers side is shown. The bracket gets located by measuring from the lower control arm frame bracket. The front lower corner of the frame bracket is located **7 1/8"** (measuring towards the rear of the car) from the factory control arm bracket. This measurement is taken right where the factory bracket attaches to the frame.

5b. DRIVERS SIDE VIEW

5b. This illustration shows the frame bracket as looking from the side. With the frame bracket held in place mark the (5) mounting holes. Drill these holes with the supplied 17/32" drill bit. Install the supplied (5) 3/8"-16 Rivnuts using the tool supplied in the kit. **Refer to the Rivnut installation instructions on PAGE 7 for proper Rivnut installation.** Install a 3/8" Flat Washer one each of (5) 3/8"-16 x 1 1/4" Hex Bolts. Attach the bracket to the frame with the bolts/washers.

6.

6. Assemble the end links. First, thread a M10-1.5 Jam Nut onto the threads of the male end link body. Next, thread the male end link body into the female end link body. Set them to 2 3/4" center to center of the end links. Keep the studs of the end links 180° of each other and tighten the jam nut against the female end link.

Final Tightening and Adjusting

7. Install the PosiLinks in the frame brackets and in the FRONT hole in the MuscleBar. **The Posilinks are installed with the stud on the upper PosiLink pointing outward and the stud on the lower PosiLink pointing to the inside of the car.** Install the 10mm Nylok on Posilink and tighten nut.

8. Tighten the 7/16" Nylok nuts on the U-bolts making sure the Musclebar is centered on the rear end.

9. Install the locking rings on the outside of each bushing assembly. Use a hex key to take the locking ring apart. Reassemble it on the bar positioned next to the inside of the bushing assembly. Push the locking ring up against the bushing assembly and tighten.

10. The MuscleBar has (3) holes in the arms for adjustment. The front hole is the standard hole. You can stiffen the bar by moving the Posilink in to the holes closer to the differential. We recommend going one set of holes at a time when tuning. Going too stiff could make the car oversteer.

Rivnut® Installation & Specs

1. Drill Hole in Frame using the SUPPLIED DRILL BIT keeping the Drill square with the metal.

2. We recommend installing (2) 3/8" Flat Washers between the bolt head and the lower anvil of the installation tool. Thread a Rivnut® onto the supplied Tool. Thread the Rivnut all the way onto the Tool until it stops.

3. Insert the Tool and Rivnut® into the drilled hole 90° to the Frame Rail.

4. The Tool requires (2) 9/16" Wrenches to use. A Ratchet can be used on the top of the Tool.

KEEP THE TOOL AND RIVNUT 90° TO THE SURFACE WHILE TIGHTENING

5. Put a 9/16" Wrench on the Lower Hex of the tool. Use a Wrench or Ratchet on the Top hex to Tighten.

6. Hold the Wrench in one position and turn the TOP HEX CLOCKWISE to engage the Rivnut®. Keep Turning the TOP WRENCH until you feel a positive stop and you can't turn the TOP WRENCH anymore.

7. Break the Tool loose by turning the TOP HEX counterclockwise and thread the Tool out of the Rivnut®
