The majority of the StreetGrip components will be installed together. For example, the Front CoilSprings, Drop Spindles, Control Arm Bushings and Shocks will be installed in conjunction with each other. On the rear, the C-Notches, Panhard Kit, CoilSprings and Shocks will be installed in conjunction with each other. The front Sway Bar will need to be installed **after** the rest of the front components are installed.

THIS KIT WILL NOT FIT TRUCKS WITH REAR LEAF SPRINGS.

Getting Started.....

Congratulations on your purchase of the Ridetech StreetGrip Kit. This system has been designed to give your Truck excellent ride and handling along with a lifetime of enjoyment. Some of the key features of this Kit: Dual Rate Rear CoilSprings, Delrin Control Arm Bushings with new Cross Shafts, Larger Swaybar with Delrin Liners, Drop Spindles, Longer & Relocated Panhard Bar, and C-Notches.

The majority of the StreetGrip Components will be installed together. For example, the Front CoilSprings, Drop Spindles, Control Arm Bushings and Shocks will be installed in conjunction with each other. On the rear, the CoilSprings, Panhard Kit and Shocks will be installed in conjunction with each other. The Rear C-Notches can be installed at anytime during the rear component installation. The front Sway Bar will need to be installed after the rest of the front components are installed.

Hardware Kit#99010066

The StreetGrip Kit is supplied with a hardware kit. This hardware kit contains individual bags for the different kits within the main kit. The bags are labeled to help determine the correct hardware for the installation of the specific kits. The instructions will aid you in selecting the correct hardware for each component. The bags included in this kit are:

Front Sway Bar Kit Control Arm Kit Panhard Bar Kit C-Notch Kit Front Shock Kit Rear Shock Kit

Front Suspension

The front components that will need to be installed are: Control Arm Bushings, Drop Spindles, Shocks, and CoilSprings. The Sway Bar needs to be installed after the rest of the front components are installed.

If you have never done this type of work before, we recommend getting a Factory Service Manual for proper procedures of disassembly and reassembly of the components for your truck.

Rear Suspension

The rear components that will be installed are rear CoilSprings, C-Notches, Panhard Kit, and rear HQ Series Shocks. The Panhard Bar has been lengthened and relocated to minimize the rear differential movement.

Alignment Specs

Anytime you change suspension components, you should have the car alignment checked. Suggested Alignment Specs:

		•
Camber:	Street:	5 degrees
Caster:	Street:	+3.0 to + 5.0 degrees
Toe:	Street:	1/16" to 1/8" toe in

99752005	3/4"-16 Top Locknut	Lower Control Arm Shaft Nuts	4
99753004	3/4" SAE Flat Washer	Lower Control Arm Shaft Washers	4

Getting Started.....

The Front Control Arms will need to be removed from the truck. Mark the shims, they will be reinstalled in the same location they were removed from. Retain the OEM hardware for reassembly. Refer to the Factory Service Manual for disassembly procedure.

This C-10 Bushing Kit contains: 2 Upper Cross Shafts, 4 Upper Control Arm Bushing Assemblies, 2 Lower Cross Shafts and 4 Lower Control Arm Bushing Assemblies. The Upper Bushings are all the same and the Lower Bushings are the same. Be sure to match the correct Bushings with the correct locations.

The OEM Bushings are removed by threading them out of the Control Arm. It is easier to do with the cross shaft clamped in a vise.

1. Measure the Outside Width of the Control Arms and write it down before starting Bushing Removal. You will use this Dimension to check the Control Arms after the new Delrin Bushings are installed.

Delrin Bushing Installation

The Cross Shaft must be put in place and in the correct orientation before installing the Bushing Shells in the Upper & Lower Control Arms.

Just like Bushing Removal, there are several ways the Delrin Bushing Assemblies can be installed. No matter the method used, the Control Arm needs to be **SUPPORTED** to keep from distorting the Control Arm. We recommend cutting spacers to go inside the Control Arms when using a Press to install the Bushings. We have used several different methods to install the Bushing Assemblies. We are going to cover the one that worked best for us. When installing the Bushings, the Outer Shell will be installed in the Arm by itself. Next, Press in the Delrin Bushing, followed by the Inner Sleeve. **WE DO NOT RECOMMEND INSTALLING THE BUSHINGS COMPLETELY ASSEMBLED.**

DUE TO VARIATIONS IN THE THREADS OF THE CONTROL ARM, WE RECOMMEND TACK WELDING THE BUSHING SHELLS TO THE CONTROL ARM.

Note: The Delrin is self-lubricating, no lubricant is needed.

2. Disassemble the Bushing being installed. When installing Bushings in the Control Arms, insert the Cross Shaft before installing any Bushings. Support the Back Side of the Flange the Bushing is being Installed in. Use a STIFF piece of Metal clamped in a Bench Vise for the Control Arms (Figure 2). They can be supported by either the piece of Metal or by the Bench Vise with the Jaws opened wide enough to let the Bushing Shell pass through (Figure 3).

3. Use another Piece of Metal or Strong Wood to Drive the Outer Shell into the Control Arm until the Shell stops against the Control Arm.

4. Press the Delrin Bushing & Inner Sleeve into the Bushing Shell. DO NOT DRIVE IN WITH HAMMER. You may LIGHTLY tap them to get them started.

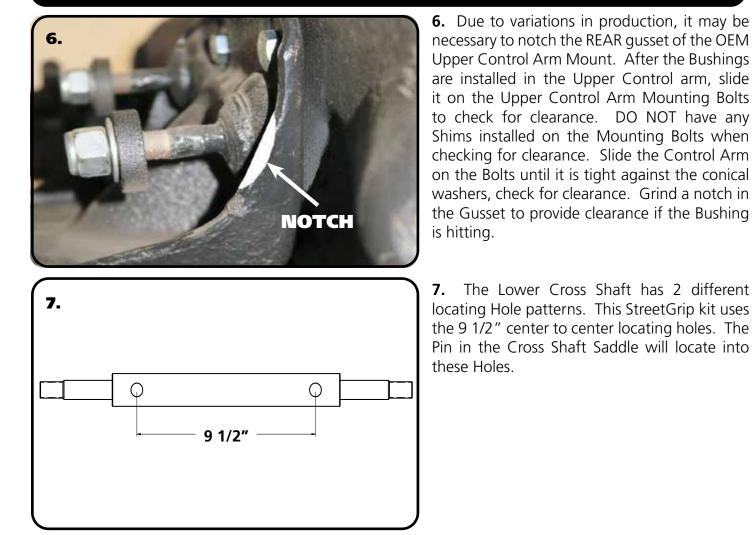

5. Reinstall the Outer Washer & Nylok Nut and finish pushing the Bushings in with the hardware. Tighten Hardware to eliminate any gaps between the Bushings and Cross Shaft.

6. Reattach Control Arms to Truck. Use the OEM Hardware & Shims to attach the Lower and Upper Control Arms.

Gusset Clearance

8. Reattach Control Arms to Truck. Use the OEM Hardware to attach the Lower making sure the Locating Pin is in the 9 1/2" center to center Holes. Reattach the Upper Control arms using the OEM Hardware and reinstalling the Alignment Shims.

Part # 11349300 (63-70) 11359300 (71-72) - C10 Drop Spindles

Major ComponentsIn the box

11349301/11359301 90001926 Pair of 63-70/71-72 drop spindles Pair of caliper brackets

Recommended Tools

Installation

Ball Joint nut Torque Specs:

Upper: Torque to 50 ft lbs and then tighten nut to align cotter pin hole not exceeding 90ft lbs. Lower: Torque to 90 ft lbs and then tighten nut to align cotter pin hole not exceeding 130 ft lbs.

Note: These spindles are set up for 1973-1987 HD Rotor and Caliper. The HD Rotor is 1 1/4" wide.

Spindle Installation

Notes:

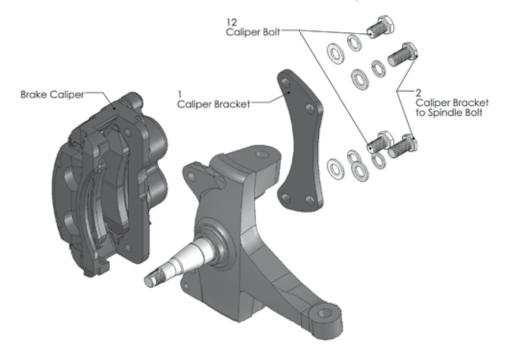

This spindle will not work with drum brakes.

A 7/16-14 bolt can be threaded into the spindle and used as an adjustable steering stop.

Instructions:

1. Remove the outer tie rods from the original spindles.

- 2. Trucks that are reusing existing 1973-1987 heavy half ton 1-1/4" thick rotors and calipers will need to remove the disc brake assemblies from the spindles. Trucks that are not reusing the existing brakes need to disconnect the brake hose from the brake line.
- 3. Remove the upper and lower ball joints from the spindle.
- 4. Remove the old spindles.

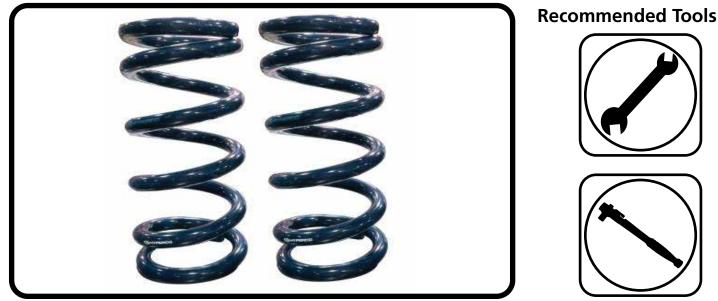

- 5. Install the new drop spindles onto the upper and lower ball joints.
- 6. Install the outer tie rods into the new spindles.
- Install the caliper brackets. The supplied calper brackets are designed to utilize 1973-87 heavy half ton 1-1/4" thick rotors and calipers. The brackets will mount to the inboard side of the spindle.
- 8. Pack the wheel bearings with grease. Install the inner bearings and the grease seal. Install the rotor/hub assembly. Install the outer wheel bearing, washer and spindle nut. Adjust the wheel bearings as follows:
- a. Tighten the nut only slightly (no more than 12lb/ft.) spin the rotor in a forward direction to ensure the bearings are fully seated.
- b. Check that the spindle nut is still tight. If not repeat step a.

- c. Loosen the spindle nut until it is just loose.
- d. Hand tighten the spindle nut and install the cotter pin. Do not use a wrench! If necessary loosen the nut too the first position the cotter pin can be installed into.
- 9. Install the caliper assemblies. The bleed screws will be towards the top.
- 10. If using new calipers connect the brake hose to the calipers and the frame. Bleed the brakes. Check for leeks.
- 11. Check that the rotor can turn freely and that the brakes do not drag.
- 12. Have the truck professionally aligned.

Part # 11332350/11332351 - 1963-1972 C10 Front CoilSpring

1963-1972 GM C10 Front CoilSprings Installation Instructions

Table of contents

Page 11..... CoilSpring Installation

Major ComponentsIn the box

Part #	Description	QTY
55104200	Front CoilSprings	2
90002589	Front Coil Spring Seat	2
90002634	Big Block CoilSpring Spacer - BIG BLOCK ONLY	4

The Front Control Arm Bushings and Spindles should be installed before installing springs. The Front Suspension should be assembled with the Lower Ball Joint disconnected from the Spindle.

The C10 StreetGrip CoilSpring utilizes an Upper Spring Seat setup. This Spring Seat setup allows the height of the truck to be adjusted by shimming the spring. Shims can be purchased through Ridetech or an authorized Ridetech Dealer.

Getting Started.....

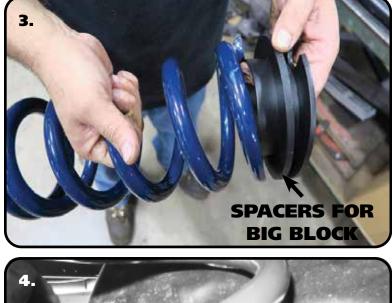

1. Remove the OEM Bumpstop from the lower control arm. Put a small pry bar under one end and pry it up, work your way to the other end prying it out as you go.

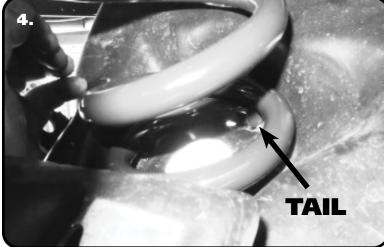

2. The Upper Coil Spring Seat is notched for a Rivet in the OEM Seat. The Notch MUST be lined up with the Rivet when installing the CoilSpring/Seat Combo.

3. The CoilSpring Seat is positioned on the top of the Coil Spring with the ring inserted into the CoilSpring. **Small Block requires NO Spacers. Big Block trucks require 2 Spacers on the Spring Seat**.

BIG BLOCK ONLY - Install 2 Spacers on each CoilSpring Seat before setting it on the Spring.

4. Insert the CoilSpring/Seat combo into the OEM coilspring pocket aligning the Rivet in the notch of the Upper Seat. Twist the spring on the Upper Seat to get the bottom of the CoilSpring lined up with the receiver in the control arm. The end of the CoilSpring needs to be nested into the receiver area of the Control Arm. Jack the control arm up to seat the CoilSpring and attached the bottom of the shock. With the Control Arm jacked up into position, install the bottom of the Spindle onto the Ball Joint Pin. Torque the Ball Joint nut to 90 ft lbs and then tighten nut to align cotter pin hole, not exceeding 130 ft lbs.

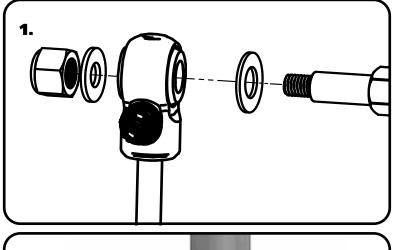

3.85" HQ Series Smooth Body Front Shocks

Major ComponentsIn the box

	Part #	Description	QTY
	986-10-035	3.85" Stroke Shock	2
	70011138	3/4" ID Shock Bushing (Installed in Shock)	4
	90002102	1/2" ID Shock Sleeve (Installed in Body)	2

	99502003	1/2"-20 Thin Nylok Nut	2
	99503001	1/2" Flat Washer	4

Shock Installation

1. The Shock is supplied with 5/8" & 1/2" Sleeves. If the Sleeves are not installed, insert a 5/8" Sleeve in the shock eyelet bushing and the 1/2" Sleeve in the shock body bushing. They can be pressed in with a bench vise. Install the Eyelet of the shock on the OEM frame stud using the OEM hardware. Position the Shock with the Adjuster Knob pointing out, away from the frame.

2. Attach the bottom of the Shock in the OEM location using the 1/2"-20 x 2 1/2" Bolt, Nut & Flat Washers supplied in the kit. The Lower Shock is Bolted to the Lower OEM Mount using the supplied Shock Sleeve.

8	99373002	3/8" Flat Washer			

Getting Started.....

This sway bar kit utilizes a anti-friction lining in the sway bar bushing. The lining allows the sway bar to move freely and quietly in the bushing. No lubrication is required.

This sway bar will fit 63-66, 67-72 & 73-87, but the installation varies between the 3 eras. Be sure that you are reading the instructions for the correct era of truck.

1. Jack the vehicle up to a safe working height and support with jack stands. Make sure the jack stands are stable before working under the truck.

2. If the truck is equipped with a stock swaybar, remove it.

63-66 ONLY! 3a & 3b. The mounting holes for the frame mount will need to be drilled. The frame mount will attach to the frame with the ANGLED END FORWARD. The front edge of the frame mount will be aligned with the rear edge of the slot in the frame that is forward of the cross member. Hold the frame mount on the center on the frame with the front edge lined up with the rear edge of the slot. Use the frame mount as a template to mark the holes to be drilled. Drill the holes using a 3/8" drill bit. Attach the bracket using a 3/8"-16 x 1 1/4" bolt, 3/8"-16 nylok nut and a 3/8" flat washer on top and bottom. The same hardware setup is used in each hole. Repeat on the other side and torque hardware. **SKIP TO STEP 9.**

4. Remove the rivet from the bottom of the frame rail. This can be done by cutting the rivet head off and driving it out or by drilling it out. This cross member is located in front of the suspension cross member.

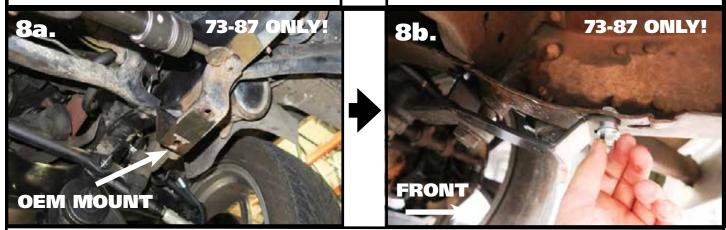

6. With the rear hardware installed, line up the bracket parallel with the frame rail. Use the front hole as a guide to drill a 3/8" hole in the frame.

5. Attach the rear hole of the Frame Mounting Bracket to the frame using the rivet hole. The end of the frame bracket with the angled bends goes forward. Attach the bracket using a $3/8"-16 \times 11/4"$ bolt, 3/8"-16 Nylok nut and a 3/8" Flat Washer on top and bottom.

7. Attach the front of the bracket using a 3/8"-16 x 1 1/4" bolt, 3/8"-16 Nylok nut and a 3/8" Flat Washer on top and bottom. Repeat on the other side and tighten hardware. **SKIP TO STEP 9.**

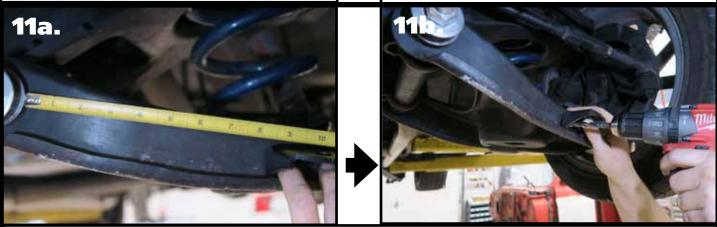

73-87 ONLY! 8a & 8b. If your truck is equipped with an OEM swaybar, the OEM mount will need to be removed to install the StreetGrip Sway Bar. This is done by removing the rivets. The rivets can be removed by chiseling the heads off and driving them out or by drilling the rivets out. The new Frame Mount bolts directly in place of the old mount. If your truck doesn't have a sway bar, the mounting holes will still be in the frame. The Sway Bar Mount attaches to the frame using the holes from the OEM mount. The end of the frame bracket with the angled bends goes forward. Attach the bracket using a 3/8"-16 x 1 1/4" bolt, 3/8"-16 nylok nut and a 3/8" flat washer on top and bottom. The same hardware setup is used in each hole. Repeat on the other side and torque hardware.

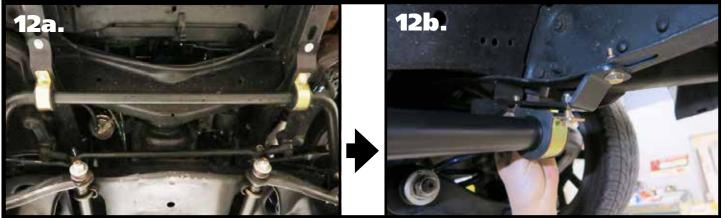

9. Open the sway bar bushing at the split and slide it **OVER** the swasy bar. Do this for both bushings.

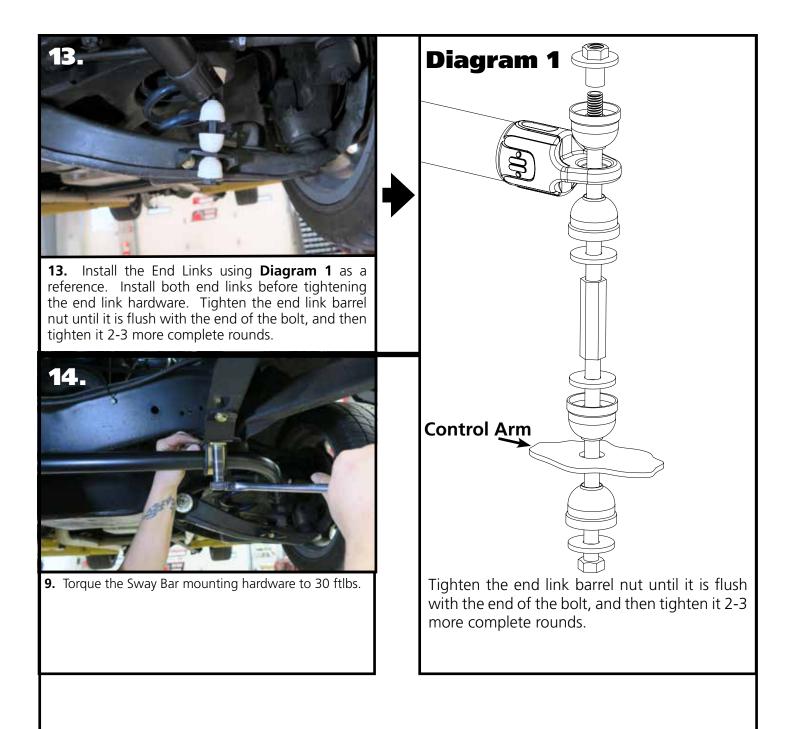

10. Next, slip the bushing straps over the sway bar bushings.

11a & 11b. This kit requires a Bracket to be installed on the control arm for the sway bar linkage. The Bracket needs to be positioned with the inside edge 8 1/4" from the CONTROL ARM BUSHING and the ears pointing DOWN. Hold the end of the tape measure against the outer edge of the Control Arm Bushing and make a mark on the Control Arm at 8 1/4". Hold the Bracket on the Control Arm with the ears pointing DOWN and against the lip of the control arm. Use the bracket to mark and drill the mounting holes to 3/8". Install a 3/8" Flat Washer on (2) 3/8"-16 x 1 1/4" Hex Bolts and insert them into the holes. Install a 3/8" Flat Washer and 3/8"-16 Nylok Nut on each Bolt. Repeat on the other side and torque hardware.

12a & 12b. Hold the Sway Bar into position on the truck with the Sway Bar arms below the tie rods. Align the holes in the Bushing Straps with the holes in the Frame Brackets. Install a 3/8" Flat Washer on (4) 3/8"-16 x 1 1/4" Hex Bolts and insert them into the holes. Install a 3/8" Flat Washer and 3/8"-16 Nylok Nut on each Bolt. Center the bar in the bushings before snugging up the hardware. Do **NOT** completely tighten the Hardware. It will be left partially loose until the End Links are installed.

Part # 11334799 - 1963-1972 C10 Rear CoilSpring

1963-1972 C10 Rear Dual Rate CoilSprings Installation Instructions

CoilSpring # 55260356 Installation

Rear dual-rate springs allow the vehicle to transition small road irregularities via a soft spring rate. When the vehicle compresses the spring far enough (through large bumps or cornering), it transitions to the firmer spring rate to control the bump or body roll. We have worked closely with Hyperco to develop custom dual rates to ensure the best ride possible.

The Rear Shocks & Panhard Kit should be installed at the same time as the Rear CoilSprings.

1. Refer to the Factory Service Manual for CoilSpring Removal.

2. Position the Spring in the OEM location with the CLOSE coils to the bottom. Attach the top of the spring to the frame rail with the OEM hardware.

3. With the top of the spring attached, slowly Jack the Differential up until the bottom Spring can be attached to the trailing arm using the OEM Hardware.

Installation

Part # 11339699 - 1963-1972 C10 Rear C-Notch

99372002	3/8"-16 Nylok Nut	C-Notch to Frame	8
99373003	3/8" Flat Washer	C-Notch to Frame	16

Getting Started.....

THIS C-NOTCH CAN BE INSTALLED WITH OUT REMOVING THE BED.

USE CAUTION WHEN CUTTING AND DRILLING THE FRAME RAIL. CHECK FOR BRAKE LINES, FUEL LINES AND WIRING BEFORE DOING ANY CUTTING OR DRILLING.

DEPENDING ON HOW THE LINES AND WIRING ARE INSTALLED ON THE TRUCK, THEY MAY NEED TO BE RELOCATED OR MODIFIED.

A template is supplied with the kit to aid in cutting and drilling the frame.

1. The Rivet needs to be removed from the rear of the OEM coilspring mount. One way is to cut a "+" in the head of the rivet and chisel the 4 pieces of the head off the rivet, then knock the rivet out of the frame with a hammer and punch. It can also be drilled out.

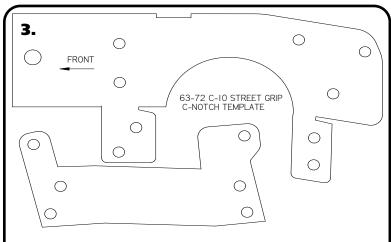

C-Notch Installation

2. Remove the OEM bumpstop mounts from the frame rails by removing the rivets. Again, one way is to cut a " "hin the head of the rivet and chisel the 4 pieces of the head off the rivet, then knock the rivet out of the frame with a hammer and punch. It can also be drilled out.

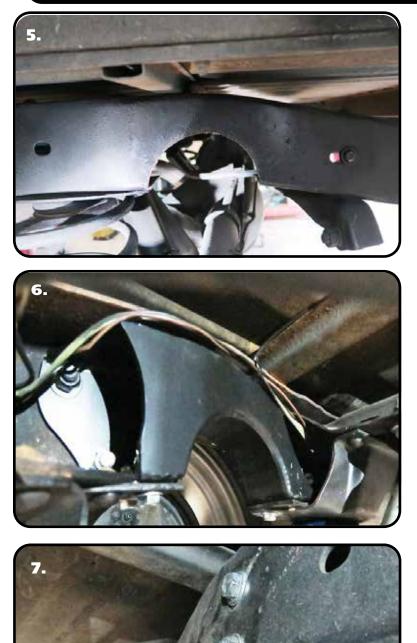

3. Use the supplied C-Notch template to mark the area to be cut and the holes to be drilled. We suggest doing one side at a time. The C-Notch template has an arrow pointing to the front of the truck. Use the 5/8" hole to locate the template on the frame. Wrap the bottom tabs around the bottom of the frame. The 2nd Template is provided to aid with the alignment of the bottom holes. The Rivet hole should line up with the front tab. Drill the side holes with a 7/16" drill bit. Drill the bottom holes with a 3/8" drill bit.

4. Diagram "3" shows the frame rail marked before cutting. The bottom of the frame will also need marked for cutting.

C-Notch Installation

5. Diagram "4" shows the side and bottom of the frame after it has been cut.

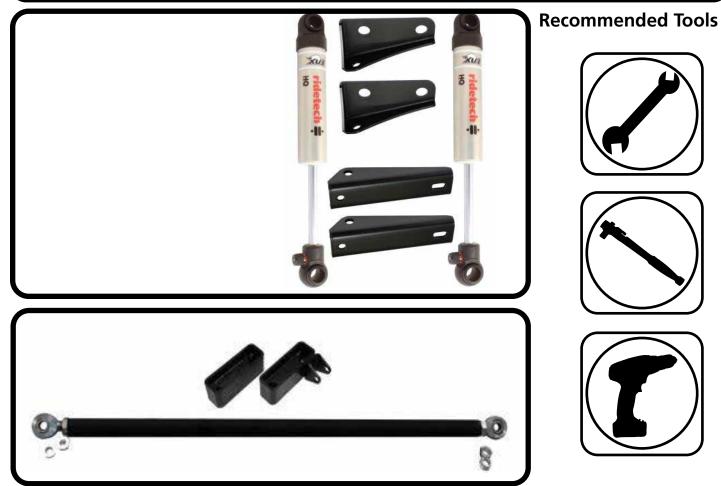

6. Slide the C-Notch into the frame rail.

7. Install a 7/16" Flat Washer on (5) 7/16"-14 x 1 1/4" Hex Bolts. Insert them through the holes in the frame side. Install a 7/16" Flat Washer and 7/16"-14 Nylok. Install a 3/8" Flat Washer on (4) 3/8"-16 x 1 1/4" Hex Bolts, insert them in the bottom holes and install a 3/8" Flat Washer and 3/8"-16 Nylok Nut on the threads sticking through. Tighten all hardware and repeat on other side.

Shock Mount Installation

3.

1. Remove the OEM shocks and panhard bar from the Truck.

2. The rivets holding the OEM upper shock mount will need to be removed. One way is to cut a " + "-In the head of the rivet and chisel the 4 pieces of the head off the rivet, then knock the rivet out of the frame with a hammer and punch. They can also be drilled out.

3. Drill the 4 rivet holes out to 7/16".

4. Install a 7/16" Flat Washer on each 7/16"-14 x 1 1/4" Bolts. Position the Shock Bracket in the same location as the OEM shock mount with the shock mounting holes to the rear of the truck. Line up the front and rear holes and insert the 7/16" Bolt/Washer from the bottom with the threads pointing up. Install a 7/16" Flat Washer and 7/16"-14 Nylok on the threads of the bolt. Repeat steps 3-5 on both shock mounts. Tighten Hardware.

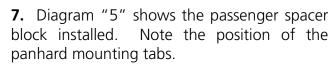

Spacer Block Installation

5. Remove the OEM lower shock mount by removing the u-bolt nuts. Remove the U-Bolts.

6. The kit contains 2 spacer blocks with one having the panhard mount welded to it. The spacers are installed between the axle and the trailing arm. The spacer block with the mount welded to it is installed on the passenger side with the mount positioned to the rear inside. Remove the OEM u-bolt and install the u-bolt supplied in the kit. Slide the spacer block onto the u-bolt followed by the OEM trailing arm.

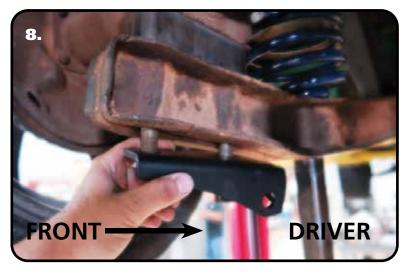

Repeat this process for both spacer blocks.

7. PASSENGER

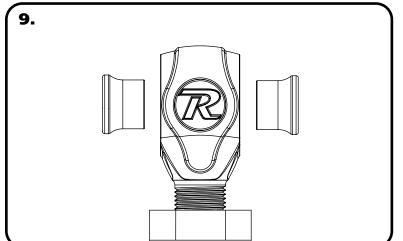

Lower Shock Mount & Panhard Bar Installation

8. Next, install the Lower Shock Brackets. The brackets are installed on the U-Bolts, on the bottom side of the trailing arm. The shock mounting hole should be positioned with the hole to the front and to the inside of the truck. Once the Mount is installed, install a 3/4" Flat Washer and 3/4"-16 Nylok Nut on each leg of the U-Bolts. Tighten the Nylok Nuts to 350ftlbs.

9. Assemble the Panhard bar. Install a 3/4"-16 Jam Nut on the shank of the R-Joint end. Thread the R-Joint end into the bar. Set the Center to Center dimension of the panhard bar to 36". Install the R-joint Spacers into the center pivot ball of the R-Joint. Insert the small end of the spacer into the center ball, push it in until it stops.

10. Install the panhard bar in the frame mount. Install a 5/8" Flat Washer on a 5/8"-18 x 3 1/2" Hex Bolt and insert it through the Mount, Spacers and Panhard bar. With the Bolt installed, install a 5/8" Flat Washer on the threads followed by a 5/8"-18 Nylok Nut.

Shock Installation

12. DI SIDE DRIVER

11. Repeat the procedure in step 9 on the axle side of the Panhard Bar. You may need to push the rear differential to one side or the other to get the Panhard bar lined up in the Mount.

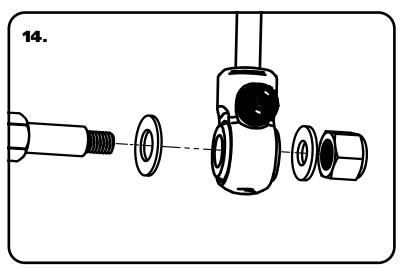

12. Install the supplied Shock stud in the Lower Shock Mount. The stud should be installed with the STUD pointing to the center of the truck. Install a 5/8" Washer (supplied with stud kit) on the 5/8"-18 Thread side of the Stud and insert it into the Shock Bracket. Install a 5/8" Washer and Nylok Nut on the threads and tighten. Do this for both shock brackets, installing the Studs with the small threads pointing to the center of the truck.

13. The Shock is mounted in the Upper Mount with the BODY UP. It is held in place with a $1/2"-20 \times 2 \ 3/4"$ Hex Bolt & 1/2"-20 Nylok with a 1/2" Flat Washer on each side of the bracket.

Finishing

14. The Eyelet end of the Shock needs to be installed on the Stud. First, install a 5/8" Washer on the Stud. Next, slide the Shock Eyelet on the Shock Stud. You will have to jack the rear differential up to get the shock installed on the stud. Once the Shock is on the Stud, install a 7/16" washer and 7/16"-20 Nylok Nut. Repeat on other side and tighten hardware.

15. Tighten the Hardware

16. The Panhard is designed to keep the rear differential centered at ride height. After the remainder of the StreetGrip is installed, measure the axle center position. It is best to

measure it from the frame to the axle, but make sure you are measuring in the same spot on both sides. If the axle is not centered in the frame by changing the length of the panhard bar. 1 complete revolution of the R-joint end is 1/16".

Shock adjustment 101- Single Adjustable

Rebound Adjustment:

How to adjust your new shocks

The rebound adjustment knob is located on the top of the shock absorber protruding from the eyelet or stud top. You must first begin at the ZERO setting, then set the shock to a street setting of 12 or handling setting of 8.

-Begin with the shocks adjusted to the ZERO rebound position (full stiff). Do this by rotating the rebound adjuster knob clockwise until it stops.

-Now turn the rebound adjuster knob counter clockwise 12 clicks. This sets the shock at 12 for a street setting. If you are after a handling setting only go 8 clicks.

Take the vehicle for a test drive.

-if you are satisfied with the ride quality, do not do anything, you are set!

-if the vehicle is too soft increase the damping effect by rotating the rebound knob clockwise 3 additional clicks.

-If the vehicle is too stiff rotate the rebound adjustment knob counter clock wise 2 clicks and you are set!

Take the vehicle for another test drive and repeat the above steps until the ride quality is satisfactory.

Note:

One end of the vehicle will likely reach the desired setting before the other end. If this happens stop adjusting the satisfied end and keep adjusting the unsatisfied end until the overall ride quality is satisfactory.
